DBMS Assignment

Ans-1) Database security issues refer to problems, risks or challenges that threaten the confidentiality integrity, & availability of data stored in a database system. these issues arise due to legal regulations, organizational policies or technical weaknesses in the system.

1) legal & ethical issues =>

- organizations store sensitive data such as personal details, financial information & medical records.
- employees must maintain confidentiality & responsible data usage.

2) Policy issues =>

- security policies define who can access, modify or delete data.
- weak policies can lead to unauthorized access & misuse of information.

3) system - related issues =>

- Poor system configuration can allow hackers to exploit vulnerabilities.
- weak authentication, outdated software or lack of encryption can compromise database security.

Ans-2) Database security control techniques

1) Access control =>

- It ensures that users can access only the data they are permited to view or modify
- Implemented user authentication, passwords & role based permissions.

2) Inference control =>

- Sometimes users combine different pieces of data to infer sensitive info.
- inference control techniques limit or modify query results to prevent such deductions.

3) Flow control

- ensures that info. moves only according to predefined security rules.
- Prevents sensitive data from flowing from high-security units to lower security units.

4) data encryption =>

- only users with the correct decryption key can read the data.
- Protects data during storage & transmission.

Ans -3) CREATE VIEW employee_view AS
SELECT EmpID, EmpName, DeptName
FROM employee;

explanation ⇒

CREATE VIEW employee_view ⇒ creates a virtual table named employee_view.

SELECT EmpID, EmpName, DepID ⇒ selects only these 3 columns

FROM employee ⇒ data is taken from the employee table.
